MEDORG CLINICAL DOCUMENTATION

REPORT: MRI Brain Scan Results

Patient: Thomas Keller (MED-000002) | Provider: Dr. Rafael Ortiz
Facility: Bayview General Hospital | Date: March 15, 2024

EXAMINATION PROTOCOL

Multi-sequence multi-planar MRI of the brain without intravenous gadolinium contrast.
Clinical Indication: Intermittent tension headaches and surveillance.

IMAGING FINDINGS

Cerebral parenchyma demonstrates normal signal intensity throughout.
No acute intracranial hemorrhage, territorial infarction, or mass effect.
Ventricles and basal cisterns are age-appropriate in size and configuration.
Minor non-specific punctate T2/FLAIR hyperintensities in subcortical white matter, consistent with chronic microvascular changes.

IMPRESSION

1. No acute intracranial pathology.
2. Age-appropriate non-specific microvascular white matter changes.
